

Technical Documents:

June 22. We executed the "re-ds" system imaging process and completed setups on multiple laptops. We also provided remote and cross-department helpdesk support, communicating with employees to address active laptop issues and establishing remote desktop connections to clean up target Drive C storage.

June 23. Our team focused on handling daily employee technical issues, prioritizing laptops experiencing "No Network" connectivity. We resolved these service requests by updating network drivers, deploying necessary software patches, and executing the `gpupdate /force` command within CMD to refresh group policies.

June 24. We communicated with employees from other departments to troubleshoot and resolve their active laptop concerns. Aside from standard user support, we spent the remaining time preparing and finalizing our slide deck for three individual project proposals scheduled for presentation the following day.

June 25. We successfully presented our three individual project proposals to the team. Following the presentations, we returned to helpdesk duties by assisting cross-department employees with their laptop concerns and executing the "re-ds" system imaging process on units allocated for the employee loaner program.

June 26. We performed "re-ds" imaging and setups on deployment laptops and assisted users with technical issues, specifically focusing on BitLocker lockout problems. We resolved these encryption issues by retrieving the proper BitLocker Recovery Passwords via Active Directory and entering them onto the affected laptops.
