

Date: June 8, 2026 - June 11, 2026

Technical Documents:

June 8. On this day, we were trained on secure data migration protocols by transferring critical user files over to our IT admin account. We also handled active helpdesk support, focusing heavily on fixing "No Network" connection errors by executing the `gpupdate /force` command in CMD, deploying system patches, and updating network drivers to restore employee connectivity.

June 9. Our training continued with system provisioning, where we learned how to "re-ds" (re-image) and fully set up laptops designated for the company's employee borrowing program. Along with device setups, we assisted users with incoming hardware and software concerns, utilizing `gpupdate /force` in CMD, software patching, and driver updates to resolve widespread network connectivity issues.

June 10. We focused on remote endpoint optimization and secure file management by executing admin account data transfers. We actively remoted into employee laptops to perform deep cleanups on their Drive C storage, while simultaneously managing standard helpdesk concerns, including troubleshooting network blackouts via the `gpupdate /force` command and driver updates.

June 11. We logged and categorized safekeep and deployment laptops, along with their respective accessories, into a master Excel asset tracking file to ensure quick inventory retrieval. Additionally, we performed remote Drive C storage optimizations, resolved daily employee technical concerns,

deployed loaner laptops to users, and successfully managed the compliance workflow by securing signed User Acceptance Forms prior to device deployment.
